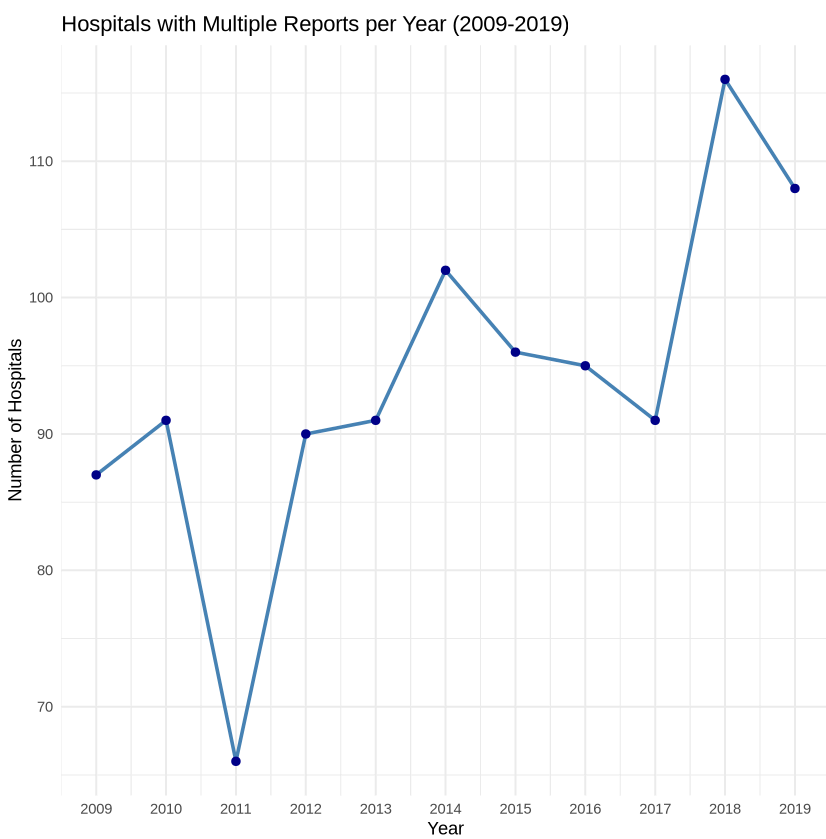
Question 1: From 2009-2019, how many hospitals filed more than one report in the same year?

```
Rows: 78508 Columns: 47
── Column specification ────────────────────────────────────────────────────────
Delimiter: "\t"
chr (12): provider_number, fy_start, fy_end, date_processed, date_created, d...
dbl (34): report, status, year, beds, tot_charges, net_pat_rev, tot_discount...
lgl  (1): npi

ℹ Use `spec()` to retrieve the full column specification for this data.
ℹ Specify the column types or set `show_col_types = FALSE` to quiet this message.
Rows: 85496 Columns: 48
── Column specification ────────────────────────────────────────────────────────
Delimiter: "\t"
chr (12): provider_number, fy_start, fy_end, date_processed, date_created, d...
dbl (35): report, status, year, beds, tot_charges, tot_discounts, net_pat_re...
lgl  (1): npi

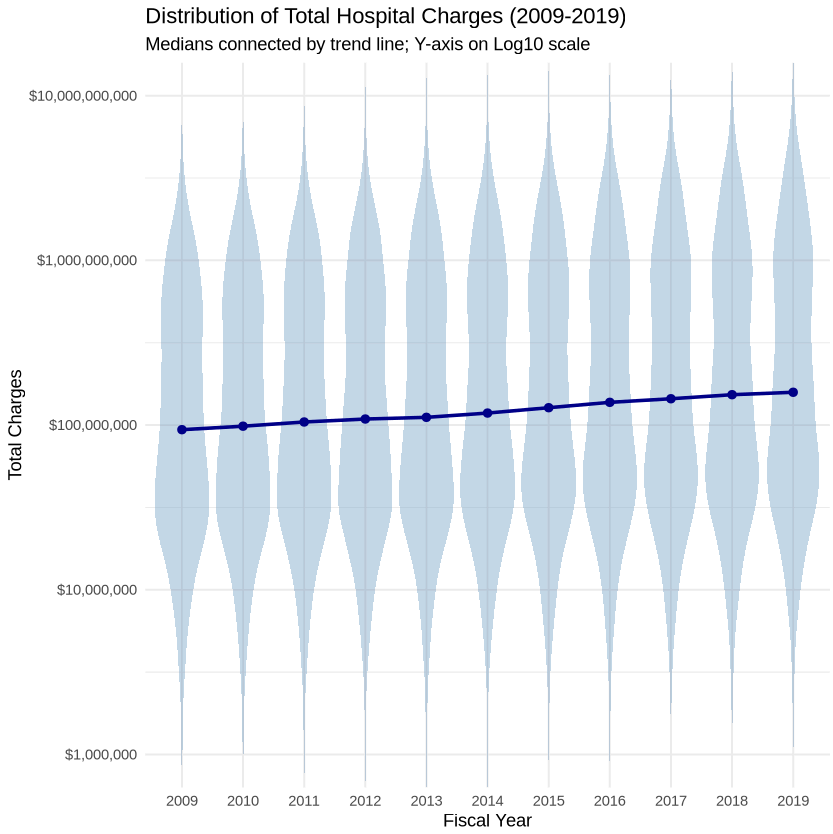
ℹ Use `spec()` to retrieve the full column specification for this data.
ℹ Specify the column types or set `show_col_types = FALSE` to quiet this message.
```



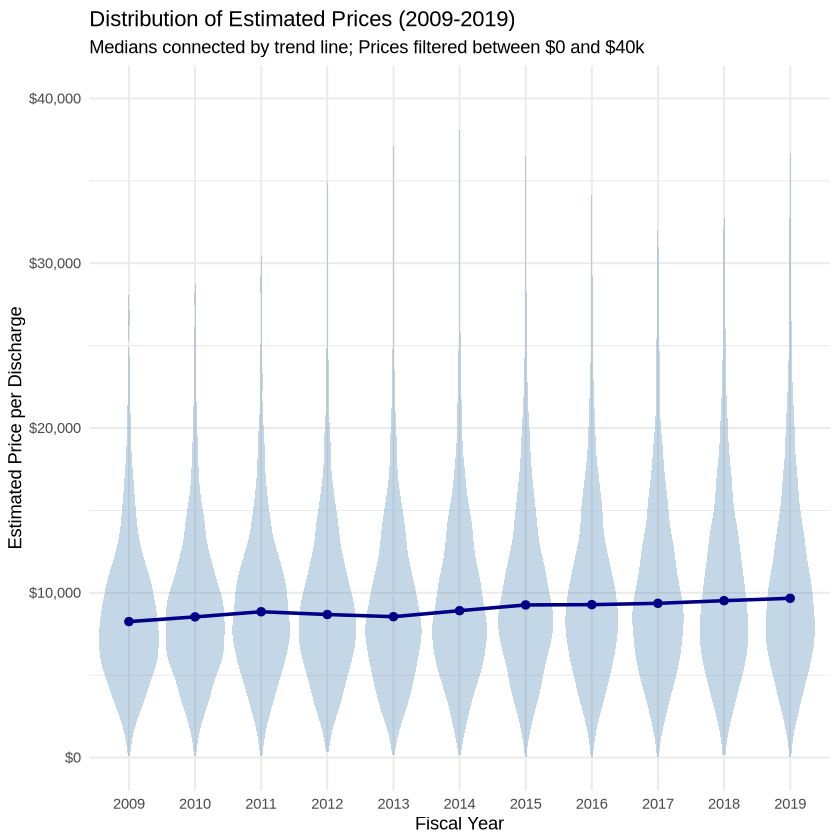
Question 2: After removing/combining multiple reports, how many unique hospital IDs (Medicare provider numbers) exist in the data?

```
Total unique Medicare provider numbers in cleaned data: 6897
```

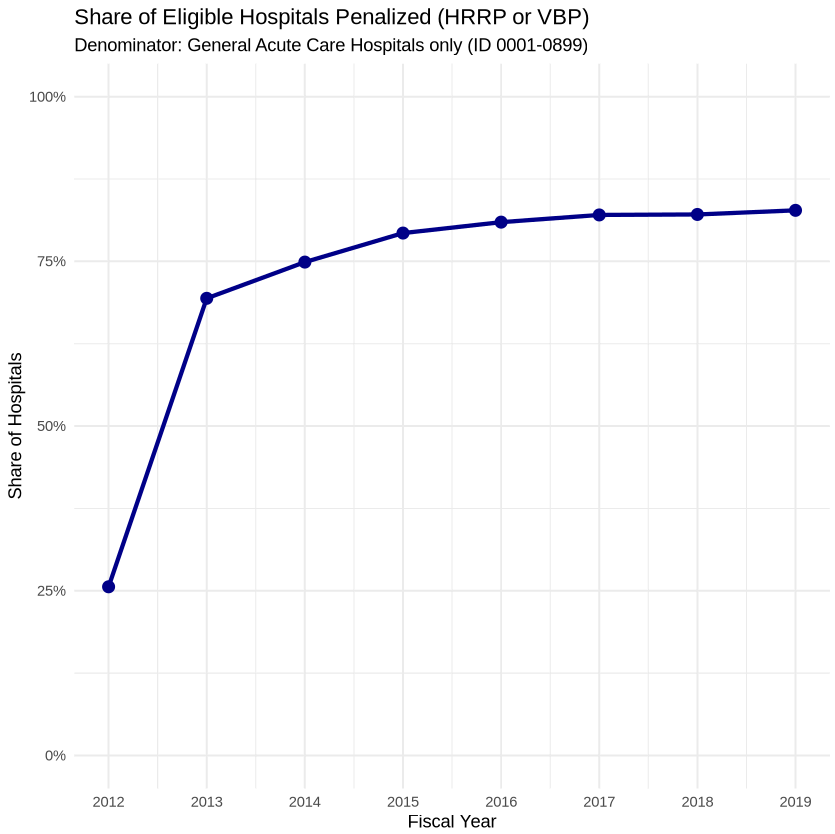
Question 3: From 2009-2019, what is the distribution of total charges (tot_charges in the data) in each year?



Question 4: From 2009-2019, what is the distribution of estimated prices in each year?



Question 5: What share of hospitals are penalized under the HRRP/VBP? (2012-2019)



Question 6: Provide a summary of OLS estimates of the effect of net penalties on price changes.

```
NOTE: 5 observations removed because of NA values (RHS: 5).

NOTE: 5 observations removed because of NA values (RHS: 5).

NOTE: 17 observations removed because of NA values (RHS: 17).
```

A etable_df: 12 × 4

		m1_ols	m2_ols	m3_ols
	<chr>	<chr>	<chr>	<chr>
1		Baseline	+ Beds	+ Medicaid

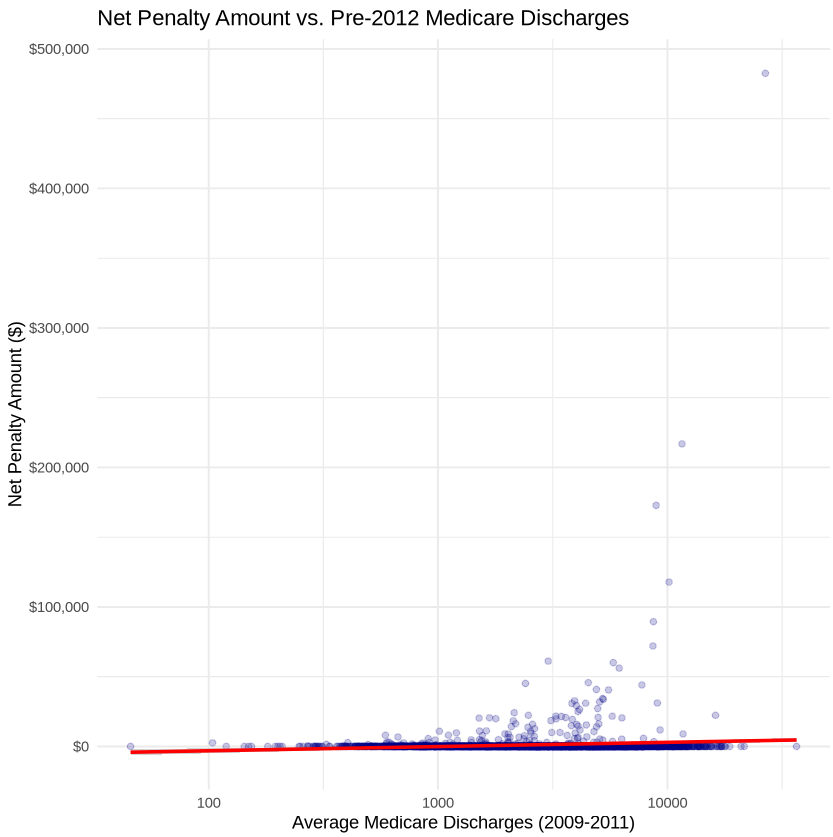
12	Adj. R2	-0.00037	-0.00068	-0.00083

Question 7: Provide a scatterplot of net penalty against pre-2012 Medicare discharges.

```
`geom_smooth()` using formula = 'y ~ x'
Warning message:
“Removed 5 rows containing non-finite values (`stat_smooth()`).”
Warning message:
“Removed 5 rows containing missing values (`geom_point()`).”
```



Question 8: Provide a summary of the first stage and reduced-form results using pre-penalty Medicare discharges as an instrument for net penalties.

```
NOTE: 5 observations removed because of NA values (LHS: 5).

NOTE: 5 observations removed because of NA values (LHS: 5).

NOTE: 17 observations removed because of NA values (LHS: 5, RHS: 12).

NOTE: 12 observations removed because of NA values (RHS: 12).
```

11	R2	-0.06897	-0.06760	-0.06400
12	Adj. R2	-0.06939	-0.06845	-0.06527

Question 10: Briefly explain the "Local" ATE in the context of your estimates. How might a local effect differ from an overall ATE in this setting?

The IV estimate represents a Local ATE because it identifies the causal impact of net penalties on price changes specifically for the hospitals whose penalty status was directly influenced by their volume of Medicare discharges (the instrument). The local effect (0.3895) is significantly larger and more statistically meaningful than the overall ATE estimated by OLS (0.0058).
